

Datasets Guide

(Data Visualization and Decision Trees)

When you are using different version of “seaborn” library, you may not be able to see the expected results correctly. Into “Datasets.rar”, you can find the datasets which have been used during the instruction. You can simply replace the load data set by “seaborn” with load data set by “read_excel” method of pandas. Following you can find an example:

```
mpg = sns.load_dataset("mpg")      =>      mpg = pd.read_excel("mpg.xlsx")
```

Also, into the datasets you can find “ManWoman.xlsx” data set for the decision tree part.
